Groundwater is the second largest source of freshwater. We use groundwater mostly for drinking, irrigation and thermoelectric power. Groundwater is the second largest source of freshwater after glaciers. But if you compare only freshwater sources, groundwater has more than 60 times the amount than lakes and streams (combined).

A Guide to Groundwater: Earth's Hidden Freshwater Supply ...

Groundwater, the "unseen" part of the hydrological cycle, is in connection and constant exchange of water with surface water bodies; groundwater aquifers are formulated due to percolation from the bottom of rivers, lakes, wetlands, estuaries and in return surface water bodies are replenished by groundwater flows (West and Obling, 2014). Although "unseen," groundwater comprises the most important source of usable freshwater at global scale.

For many important agricultural production areas, ground-water will remain the ultimate source of freshwater when surface water sources have been depleted. The aquifers that host groundwater are the primary buffers against drought for both human requirements, and crop production. In many concentrations of intensive agriculture, groundwater offers

Groundwater use for irrigation – a global inventory

1. Introduction. Sustainable water resources management is a crucial concern in most countries across the globe. Only 3% of total water on the Earth is considered as fresh water resources and approximately 30% of that is accessible as groundwater, which is vital for human health, ecosystem, energy industry and other water-dependent topics (Shiklomanov, 1993).

What is the Earth system? Scientists increasingly view Earth as a dynamic system – a combination of interrelated, interdependent or interacting parts forming a collective whole or entity. On a macro level, the Earth system maintains its existence and functions as a whole through the interactions of its parts, called components.

We provide long-term groundwater-related capability in the hydrosciences for the benefit of the UK, and internationally. Our research addresses issues related to the sustainability of water resources and quality, the impacts of environmental change on the water cycle, natural hazards in the context of groundwater, and groundwater and human health. We undertake groundwater-related monitoring and surveys and have extensive data and information, much of which is accessible through the BGS website.

These aspects of the groundwater system help determine the amount of groundwater that an area will typically store. " Basically, different aquifers store different amounts of water," he said. NASA ' s twin Gravity Recovery and Climate Experiment (GRACE) satellites can detect groundwater by measuring subtle variations in Earth ' s gravity.

Getting at groundwater with gravity | Earthdata

Groundwater, water that occurs below the surface of Earth, where it occupies all or part of the void spaces in soils or geologic strata. Groundwater plays a vital role in the development of arid and semiarid zones, sometimes supporting agricultural and industrial enterprises that could not otherwise exist.

The simplest definition of groundwater is that it is water that is underground. Of all the fresh water on Earth, about 20% is groundwater. As water seeps into the ground, it continues downward due...

What is Groundwater? - Definition & Explanation - Video ...

Karst aquifers are some of the most important sources of drinking water in the world. The term karst refers to land that forms over rock that is easily dissolved by water. In these karst terrains, water flows through caves and other large underground passages. Because the rock around them can be easily dissolved, these karst aquifers are vulnerable to contamination.

C.D. Shackelford, in Reference Module in Earth Systems and Environmental Sciences, 2013. Vertical containment technologies. Pump and treat refers to the process of pumping contaminated groundwater to a surface collection system through wells screened in the saturated zone and then treating the contaminated water with one or more ex situ treatment technologies.

Pump and Treat - an overview | ScienceDirect Topics

Groundwater is water which filters downwards through the ground to below the water table, where it is held in porous rocks. This water is in the 'saturated zone'. It flows through the ground (often very slowly) until it reaches a point of discharge such as a spring, a river or the sea.
