There are more than one billion Android devices in use today, each one a potential target. Unfortunately, many fundamental Android security features have been little more than a black box to all but the most elite security professionals—until now. In *Android Security Internals*, top Android security expert Nikolay Elenkov takes us under the hood of the Android security system. Elenkov describes Android security architecture from the bottom up, delving into the implementation of major security-related components and subsystems, like Binder IPC, permissions, cryptographic providers, and device administration. You'll learn: –How

The book provides complete coverage of fundamental IP networking in Java. It introduces the concepts behind TCP/IP and UDP and their intended use and purpose; gives complete coverage of Java networking APIs, includes an extended discussion of advanced server design, so that the various design principles and tradeoffs concerned are discussed and equips the reader with analytic queuing-theory tools to evaluate design alternatives; covers UDP multicasting, and covers multi-homed hosts, leading the reader to understand the extra programming steps and design considerations required in such environments. After reading this book the reader will have an advanced knowledge of

fundamental network design and programming concepts in the Java language, enabling them to design and implement distributed applications with advanced features and to predict their performance. Special emphasis is given to the scalable I/O facilities of Java 1.4 as well as complete treatments of multi-homing and UDP both unicast and multicast.

This document reviews security features of two most popular modern development platforms--Java and .NET (Java v1.4.2/J2EE v1.4 and .NET v1.1). The platform choice is not random, because they represent, to a certain extent, competition between UNIX-like and Windows systems, which largely defined software evolution over the last decade. Although Java applications run on Windows, and there exist UNIX bridges for .NET, the Java/UNIX and .NET/Windows combinations are used for development of a significant portion (if not majority) of applications on their

respective operating systems, so both platforms deserve a careful examination of their capabilities. Such an examination is especially important since different aspects of UNIX/Windows and Java/.NET competition have been flaming endless heated debates between proponents of both camps, which often blindly deny merits of the opposite side while at the same time praising their preferred solution. The material here is purposely structured by general categories of protection mechanism and reviewing each platform's features in those areas. This allows starting each topic with a platform-neutral security concept and performing relatively deep drill-downs for each technology without losing track of the overall focus of providing an unbiased side-by-side

comparison. The document is based on the research material that was used as a foundation of the feature article, "Securing .NET and Enterprise Java: Side by Side", which was written by Vincent Dovydaitis and myself and appeared in Numbers 3-4 of Computer Security Journal in 2002. The following areas will be considered: Security Configuration and Code Containment  
Cryptography and Communication  
Code Protection and Code Access Security, or CAS  
Authentication and User Access Security, or UAS

Parallel and distributed processing, although within the focus of computer science research for a long time, is gaining more and more importance in a wide spectrum of applications. These proceedings aim to demonstrate the use of parallel and distributed processing concepts in

different application fields, and attempt to spark interest in novel research directions to advance the embracing model of high-performance computing research in general. The objective of these workshops is to specifically address researchers coming from university, industry and governmental research organizations and application-oriented companies, in order to close the gap between purely scientific research and the applicability of the research ideas to real-life problems. Euro-Par is an annual series of international conferences dedicated to the promotion and advancement of all aspects of parallel and distributed computing. The 2007 event was the 13th issue of the conference. Euro-Par has for a long time been eager to attract colocated events sharing the same goal of promoting the development of

parallel and distributed computing, both as an industrial technique and an academic discipline, extending the frontier of both the state of the art and the state of the practice. Since 2006, Euro-Par offers researchers the chance to colocate advanced technical workshops back-to-back with the main conference. This is for a mutual benefit: the workshops can take advantage of all technical and social facilities which are set up for the conference, so that the organizational tasks are kept to a minimal level; the conference can rely on workshopsto experimentwithspeci?careasofresearch whicharenotyetmature enough, or too speci?c, to lead to an official, full-?edged topic at the conference.
