Maximum conductor temperature: 90°C For 2 core - single phase a.c., 3 & 4 core - three phase a.c. - ratings do not apply if the cable is protected by a semi-enclosed fuse to BS3036. For cables of 5 cores and above it is assumed only 2 cores are loaded simultaneously (ie live and neutral) and the 2 core rating should be taken.

If a cable is used which is too small for the amount of current passing through, it becomes dangerous. This results in the wire overheating and causing a serious safety risk. The table below gives typical values of cable size available plus corresponding current rating and maximum power ratings.

Choosing the correct size cable

The standard UK domestic electricity supply is 230 volts AC. Solid core cables should never be reused - although they can be bent into shape, they are not designed to be flexed and repeated movement can weaken the cores causing them to become weak, overheat or fail.

Current Ratings - General - for Flexible Cables

It is important to choose the correct size flex when connecting to the mains. The wire has to be the correct size so that it can cope with the power demands of the device. The size stated for flex is given in mm² and this measurement is actually the cross sectional area of the wire inside. The larger that area the higher the current it can carry.

Choosing the correct size flex

The domestic appliance power ratings shown below are indicative only. We've used the highest that we could find for popular household appliances. Electrical power is measured in watts, W, a unit of power. Electrical current is measured in amps, A, the rate at which it flows.
