the motor windings in this sensorless motor control algorithm is the six-step trapezoidal or  $120^\circ$  commutation. The Figure shows how the six-step commutation works. Each step, or sector, is equivalent to 60 electrical degrees. Six sectors make up 360 electrical degrees, or one electrical revolution.

There are two types of brushless DC motors: sensed and sensorless. Sensed BLDC motor has built-in 3 hall effect sensors, these sensors detect the rotor position of the BLDC motor. Controlling a sensed BLDC motor is easy since we know the rotor position like what was done in the project below:

For proper commutation most 3-phase BLDC driver circuits rely either on a sensor based feedback or from an external 3-phase sync signal, contrary to this our present sensorless high power BLDC motor controller circuit does not depend on sensors or any external signals for operating the motor, rather very simply processes the back EMFs from the motor winding to produce the required powerful synchronized rotational effect on the motor.
