Writing Linux Device Drivers | Part 1 | EmbeddedInn

There are two ways of programming a Linux device driver: Compile the driver along with the kernel, which is monolithic in Linux. Implement the driver as a kernel module, in which case you won't need to recompile the kernel. In this tutorial, we'll develop a driver in the form of a kernel module. A module is a specifically designed object file.

Linux Device Drivers: Tutorial for Linux Driver Development

Eventually, when you have exhausted all the previous user space options, you will find yourself having to write a device driver to access a piece of hardware attached to your device. Character drivers are the most flexible and should cover 90% of all your needs; network drivers apply if you are working with a network interface and block drivers are for mass storage. The task of writing a kernel driver is complex and beyond the scope of this book. There are some references at the end that ...

Embedded Linux device drivers: Writing a kernel device ...

This short paper tries to introduce all potential driver authors to Linux APIs for PCI device drivers. A more complete resource is the third edition of `Linux Device Drivers` by Jonathan Corbet, Alessandro Rubini, and Greg Kroah-Hartman.

Our driver is going to be a character driver, so we will write the source into the file `/usr/src/linux/drivers/char/mrv4.c`, and its header into `/usr/include/linux/mrv4.h`. The second task is to implement the driver I/O functions. In our case, `mrv4_open()`, `mrv4_read()`, `mrv4_write()`, `mrv4_ioctl()` and `mrv4_release()`.

Writing a Linux Driver | Linux Journal

Linux, instead, allows the application to read and write a block device like a char device. It permits the transfer of any number of bytes at a time. As a result, block and char devices differ only in the way data is managed internally by the kernel, and thus in the kernel/driver software interface.

The `file_operations` data structure that is defined in `/linux/fs.h` holds pointers to functions (function pointers) within a driver that allows you to define the behavior of certain file operations. For example, Listing 1 is a segment of the data structure from `/linux/fs.h`.

in writing Linux device drivers steadily increases. Most of Linux is independent of the hardware it runs on, and most users can be (happily) unaware of hardware issues. But, for each piece of hardware supported by Linux, somebody somewhere has written a driver to make

Quite a few other references are also available on the topic of writing Linux device drivers by now. I put up some (slightly outdated by now, but still worth reading, I think) notes for a talk I gave in May 1995 entitled Writing Linux Device Drivers, which is specifically oriented at character devices implemented as kernel runtime-loadable modules.
